

AMH... Simply AMazing Hormone

**A SINGLE “SUPER-SENSITIVE” TEST TO DETECT
OVARIAN OR TESTICULAR TISSUE IN DOGS AND CATS**

- **Spayed bitch or queen showing signs of oestrus after being spayed?**
- **Rescue dog or cat – has it been spayed?**
- **Male dog or cat – has it been castrated ?**

AMH (Anti-Mullerian Hormone) is produced by ovarian granulosa cells in females and sertoli cells in males and so is a very useful diagnostic test to detect the presence of ovarian or testicular tissue. Our assay allows us to detect very small amounts of AMH.

No stimulation test is required, the sample can be taken at any time and females do not need to be showing signs of oestrus.

At NationWide Specialist Laboratories we have developed and fully tested our “super-sensitive” AMH assay in conjunction with our local animal rescue centre, helping them to quickly assess the reproductive status of animals coming in to be re-homed.

Try our assay today....

**0.5mL of serum is required and the
assay is run on Thursday.**
